

**VELENA  
MAST**

Velenamast has been manufacturing aluminum mast, deck and rigging equipment at its workshop in Bodrum since 2004 for mostly new building yachts.

The company, which closely follows and applies the technological developments, has achieved significant successes by usage of the contemporary equipment & material supported by vast experience both on production and sail racing.

The CAD technical drawing environment enables to project the aluminum masts with not only good looking shape but also perfection of implementing highest technical specifications before well placed at production line. These masts are blocked in the Velenamast's own design molds and pressed with different aluminum alloys according to the specifications of masts in extrusion factories.

Profile molds are tailormade in different sizes and shapes calculated for boats with individual sizes by this technique. The parts to be added to the profiles are home produced on CNC type machines and assembled at the manufacturing phase.

Masts are formed by connecting the profiles and as the final phase the pole is mounted directly on the boat as one piece, rigged on deck with relevant components and trimmed.

VELENAMAST is committed to quality and professionalism in its manufacturing activities. It has produced over 200 aluminum masts upon the orders for both domestic and foreign markets.

As a result of the long-term Research & Development activities, Velenamast who has used the first carbon mast in one-design boat Vel25 totally produced in its shipyard has undersigned its name under the first carbon mast manufactured in Turkey.

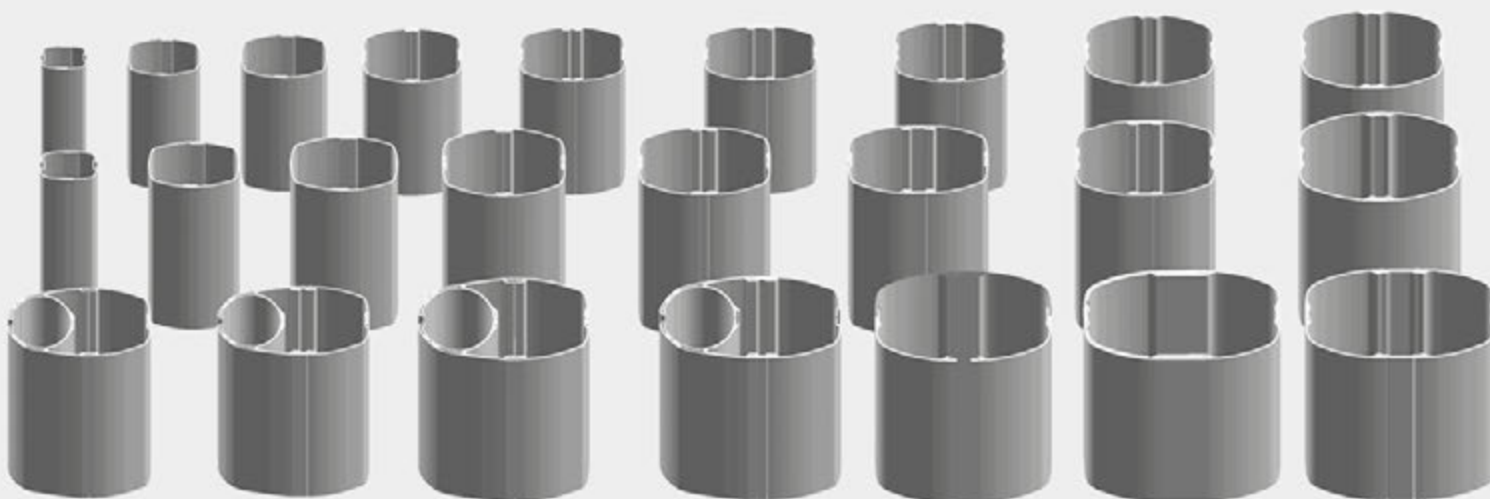

We use a wide range of aluminum extrusion profiles according to different boat sizes and weights.

These extrusion profile molds are designed by us achieving low weight ratios per meter whilst the strength values are

high. Aluminum alloys of profiles provide the best resistance to corrosion in marine environment and with their content complies the highest standard of rigid and strong body even reaching T6 thermal and mechanical resistance values.
